

A Sample Philosophical Logic Article

Abstract This concise sample illustrates the structure of a submission to *Philosophical Logic*, including citations, formal material, floats, and back matter. Replace this text with a self-contained summary of the article’s question, approach, principal result, and significance.

Keywords: modal logic; logical consequence; possible worlds

1 Introduction

The journal uses double-anonymous review. The default class mode therefore omits the author block even though author data are present in the source. Authors must still remove identifying prose and anonymize links or citations that would reveal their identity.

Number sections and subsections, and write English section headings in sentence case. Use ordinary cross-references rather than references to material “above” or “below”; for example, equation (1), Theorem 2.1, Table 1, and Figure 1 will remain identifiable if floats move during typesetting.

2 A sample formal result

Use standard L^AT_EX commands for mathematical notation. For a Kripke model $\mathcal{M} = \langle W, R, V \rangle$, the modal clause is

$$(1) \quad \mathcal{M}, w \models \Box\varphi \iff \forall v \in W (wRv \Rightarrow \mathcal{M}, v \models \varphi).$$

Introduce nonstandard notation before using it, and check every formula and derivation carefully. Very wide proofs or displays should be reorganized to fit the page.

Theorem 2.1. *The axiom schema $\Box(p \rightarrow q) \rightarrow (\Box p \rightarrow \Box q)$ is valid on every Kripke frame.*

Proof. At any world, if every accessible world satisfies $p \rightarrow q$ and every accessible world satisfies p , then every accessible world satisfies q . The claim follows from equation (1). $\square$

3 Citations and references

The class loads natbib and selects the journal’s PL.bst bibliography style. Do not load natbib yourself, and do not add a \bibliographystyle command. Use \citet for a textual citation, as in Marcus (1961), and \citep for a parenthetical citation, as in (Haack 1976).

Within a grouped citation, list the bibliography keys in chronological order: the following source code lists work from 1936 through 1977 (Tarski 1936; Marcus 1961; Kripke 1963; Lewis 1973; Haack 1976; Fischer Servi 1977). Protect capitals that must remain uppercase in a .bib title by enclosing them in braces, for example {S5} or {Kripke}.

4 Tables and figures

Include every table and figure needed for review in the submitted PDF, cite each one in the text, and give each a descriptive caption. Table 1 gives a compact example.

Frame condition	Formula schema	Standard name
Reflexive	$\Box p \rightarrow p$	T
Transitive	$\Box p \rightarrow \Box \Box p$	4
Symmetric	$p \rightarrow \Box \Diamond p$	B

Table 1: Sample modal correspondence table

Figure 1: A three-world Kripke frame

The diagram in Figure 1 is drawn with TikZ, so the template does not depend on an external image file. Authors may instead use `\includegraphics` and should retain editable or high-resolution source files for accepted manuscripts.

5 Conclusion

The conclusion is normally the last numbered section. Keep the back matter that follows concise, use only the optional headings relevant to the article, and consult the live journal and publisher policies before submission: [journal policies](#) and [author guidelines](#).

Competing interests

The authors declare that they have no competing interests.
